

Supplementary material contains:

Supplementary Figure S1: Percentage of DMS by feature type and distribution along chromosomes

Supplementary Figure S2: GO enrichment analysis for the genes containing DMS belonging to categories infection-induced and intergenerational

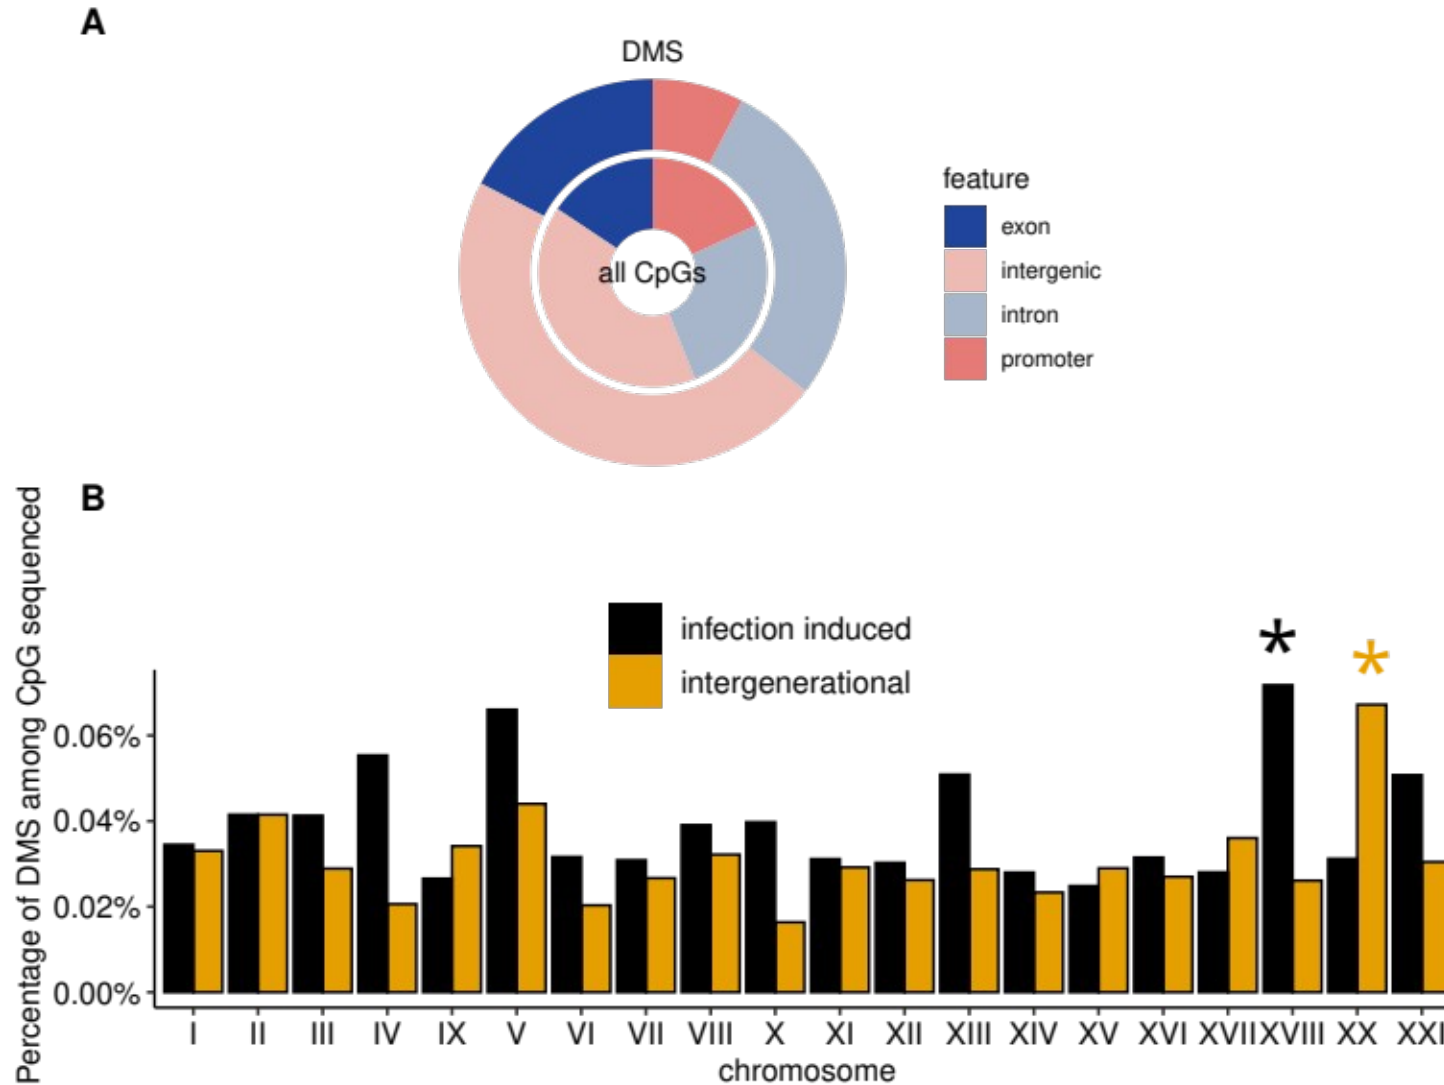

Supplementary Figure S3: Disease tolerance, measured as the slope of the regression between body condition index and parasite count, is higher in offspring from infected fathers compared to offspring from control father.

Supplementary Figure S4: In infected offspring fish from control fathers, body condition is predicted by the interaction number of worms*PCA1 and by the interaction PCA1*PCA2 at intergenerational DMS

Supplementary Table S1: DMS annotation (separate spreadsheet)

Supplementary Table S2: Composition of our dataset

Supplementary Figure S1: Percentage of DMS by feature type and distribution along chromosomes. A. Percentage of DMS (outer circle) and non DMS (inner circle) found in intergenic regions, introns, exons and promoters **B.** Distribution of DMS on chromosomes, for infection induced and intergenerational categories. Stars indicate chromosomes enriched in DMS of one category.

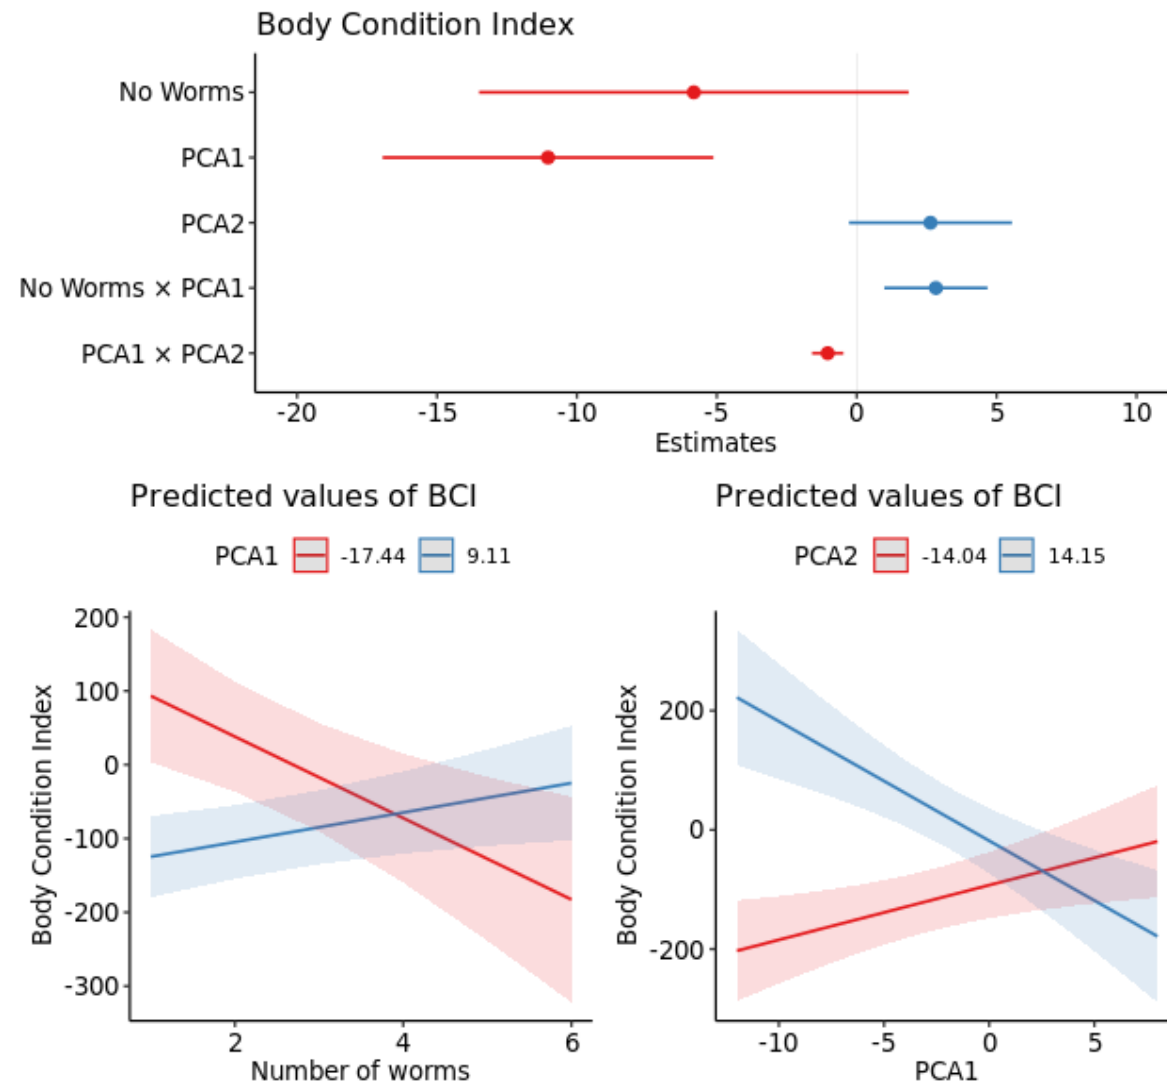

Supplementary Figure S2: GO enrichment analysis for the genes containing DMS belonging to categories infection-induced and intergenerational.

Supplementary Figure S3: Disease tolerance, measured as the slope of the regression between body condition index and parasite count, is higher in offspring from infected fathers compared to offspring from control father.

Supplementary Figure S4: In infected offspring fish from control fathers, body condition is predicted by the interaction number of worms*PCA1 and by the interaction PCA1*PCA2 at intergenerational DMS

Supplementary Table S2: Composition of our dataset
